

Bimodale Wahrscheinlichkeitsdichte über Phasen hinweg

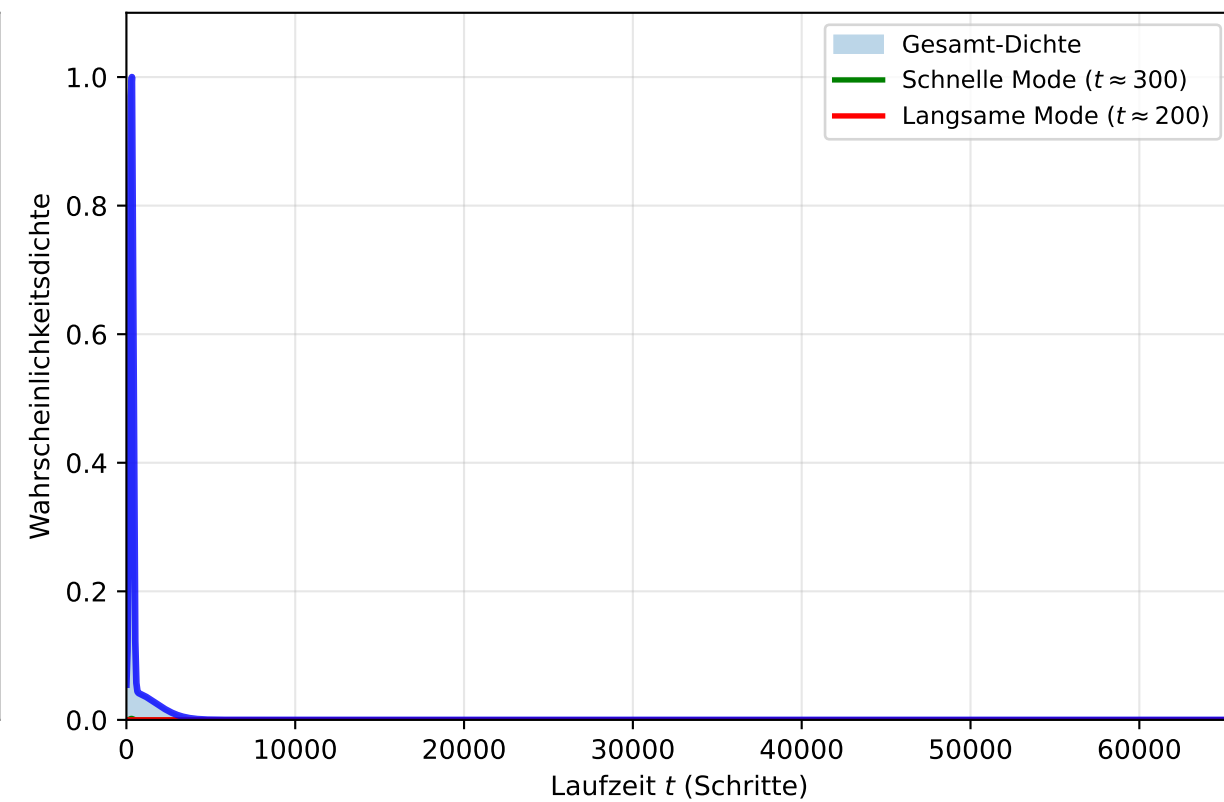

Phase 1: Initialisierung

$$(k < \sqrt{2^n})$$

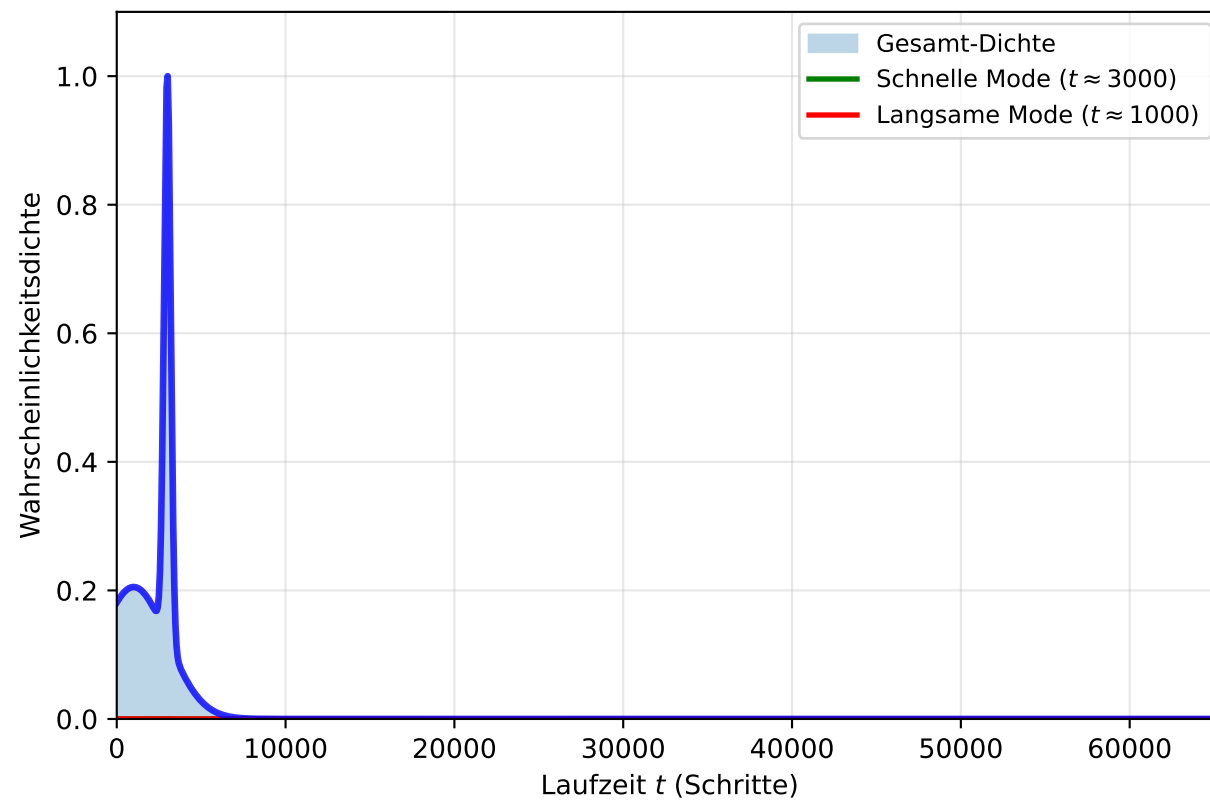

Phase 2a: Früher Übergang

$$(\sqrt{2^n} \leq k < 2^n/4)$$

Phase 2b: Später Übergang

$$(2^n/4 \leq k < 2^n/2)$$

Phase 3: Asymptotik

$$(k > 2^n/2)$$
